1
Locate tactic
Input
Source file and frozen position
Operation
Elaborate file. Find the unique tactic node.
Authored tactic and its state
2
Recover state
Input
Context C, metavariables M, ordered goals G
Operation
Keep one goal. Replay authored tactic; check recorded result.
Validated state s = (C, M, G)
3
Execute branches
Input
Validated state; fixed candidates
Operation
Restore M, G for each tactic. Run separately; record outcomes.
Independent resulting states
4
Compare endpoints
Input
Successful resulting states
Operation
Normalize using κ. Compare results across distinct tactic heads.
Endpoint classes and root witness
One step · single goal · successful domain · candidate relative
A witness has distinct heads and a shared endpoint changed from the start.
